

## STUDY ON IMPROVEMENT OF VALUATION CONSISTENCY

**P.S Hathurusinghe<sup>a</sup>**

*<sup>a</sup>Assistant Valuer, Government Valuation Department, Sri Lanka*

---

### Abstract

Consistency considered as one of the main governing principles of valuation profession where consistency issues in valuation were raised in several instances when the valuation furnished for lending institutions and assessing compensation for acquired lands. Cost base methods are more popular among the valuers in the event of assessing market value for the aforesaid purposes. The system of estimating land values were developed properly in Sri Lanka but the system of adopting rates for the improvements/constructions were not much systemized and this leads to arise consistency issues in the valuation. The study is forced to improve consistency in capital valuation when using cost base method. Literature review that there was no unique building classification and no proper market study on building rates apply for the valuation. The study proposed cost base building classification and Building Cost calculator to derive building rates as a guideline for the valuer.

### Introduction

As per RICS (2017) Transparency, Consistency and the avoidance of conflicts of interest are considered as main governing principles of valuation profession. Oxford learner's Dictionary defined Consistency as the quality of always behaving in the same way or of having the same opinions, standard, etc where improvement of the consistency is more important to ensure best service towards end users. Consistency issues were raised in several instances where the valuation furnished for lending institutions and assessing compensation for land acquisitions. Consistency improved the trust of the profession, (Chamber of commerce 2020). Accordingly, improvement of consistency of valuation is important for strengthen the profession.

Cost based method, income method and comparable method are commonly used for the capital valuation in Sri Lanka. Cost base methods are more popular among the valuers in the event of assessing market value for the mortgage purpose and assessment of compensation, where those areas covers significant market share of the profession. Land value and the improvement cost are two significant parts of the cost base valuation where the system of estimating land values were developed properly in Sri Lanka and land values are derived with analyzing market evidence in a proper way but the system of adopting rates for the improvements/constructions were not much systemized and this leads to arise consistency issues in the valuation derived by the valuers.

## **Objectives of the study**

01. To identify the area that has to improve the consistency of valuation
02. To improve the consistency of capital valuation when using the cost based method of valuation

## **Hypothesis**

The present practices of cost based methods are having consistency issues and consistency could be improved to strengthen the profession.

## **Literature Review**

### **Important of Consistency**

Lending institutions and government acquired land owners are major parties that raised consistency issue in valuation. I have observed that there were several cases raised evidences again consistency issue during the hearing of the land Acquisition board of review. Credit officers of lending institution were highlighted consistency issues in capital valuation in several forums.

### **Cost Base Method of Valuation**

#### **Cost Approach**

As per IVSC (2017) The cost approach provides an indication of value using the economic principle that a buyer will pay no more for an *asset* than the cost to obtain an *asset* of equal utility, whether by purchase or by construction, unless undue time, inconvenience, risk or other factors are involved. The approach provides an indication of value by calculating the current replacement or reproduction cost of an *asset* and making deductions for physical deterioration and all other relevant forms of obsolescence.

There are three cost approaches

01. Replacement cost method – Cost of similar assets offering equivalent utility
02. Reproduction cost method- Cost to recreating a replica of asset
03. Summation method –By addition of the separate value of its component parts

#### **Cost Considerations**

In further IVSC (2017) stated that, cost element should include in direct costs and indirect cost that would be required to replace or recreate that assets as at valuation date. Depreciation adjustments are normally considered with Physical, Fictional and External or economic obsolescence. In further it has to consider physical life and economic life of assets.

UCEM (2017) defined cost base valuation as follows,

$$\text{Value of Land and Building} = \text{Value of the site} + \text{Cost of erecting the building}$$

Where Cost of erecting the building is usually that of constructing approximately the same accommodation without unnecessary features

The RICS Standards describe DRC as ‘an estimate of the market value for the existing use of the land, plus the current gross replacement (reproduction) costs of the improvements, less allowances for physical deterioration and all relevant forms of obsolescence and optimization’.

### Contractor’s Basis

It has to make an allowance in the cost of the new building for the physical depreciation and/or functional obsolescence of the existing building. We can therefore allow for this in broad terms by applying the remainder of the life expectancy of the existing building to the construction costs of the replacement building.

**Table 1: Comparison of Cost Basis and DRC**

| <b>Contractor’s basis</b>   | <b>DRC</b>   |
|---|--|
| <b>Building costs-</b><br>Replacement cost of actual buildings, ignoring unnecessarily costly features or Cost of providing equivalent accommodation in a modern economic form (for those cases where the actual is out of date). | As in contractor’s test, save that the assumed date of construction is at costs current at the date of valuation. Deduction usually based on the predicted life of the building, agreed with the owners: e.g. for a life of 25 years, 4% per annum taken on building costs only. |

Source: UCEM, (2017).

The reinstatement cost of a property is the amount it would cost to totally rebuild the assets and further ROYAL INSTITUTE OF CHARTED SURVEYORS (2018) describe details in further, The net rebuilding cost is normally calculated by multiplying the **gross internal area** of the building by a **suitable rate for its reconstruction**. the cost of rebuilding the whole of the building in its present design and materials, to its existing shape and size, including basements, foundations and retaining walls. Evidence for current building costs can be obtained from various sources including **BCIS**, **price books** and in-house **costing** for similar projects.

### RICS Building Cost Information Service

The Building Cost Information Service (BCIS) of the Royal Institution of Chartered Surveyors (RICS ) produces a range of detailed guidance on the cost of rebuilding houses and flats. The Association of British Insurers (ABI) has commissioned BCIS to provide general guidance to help you check the adequacy of your sum insured. This site provides general guidance on the rebuilding cost of houses and some types of flats to the general public. If you require the rebuilding cost for commercial purposes, either as a surveyor, part of the insurance industry or to manage a group of properties then you should be using one of the BCIS subscription services. The following illustrate the interface of rebuilding cost calculator.

### Classification of Buildings

A simple way to see and understand buildings is to classify them according to how they **1-look** and what they **2-do** such classification typically attempts to bring together a number of similar building types or uses for one or more reasons. At a general level, buildings may be seen in terms of their history and, as such, can be categorized according to their **3.age**, **4.stylistic influences** and **5.Manner of construction**. This categorization forms the basis for the system of listing. David (2007)

Department order **No 306 (2017)** was defined building for the purpose of rating valuation as follow,

**Obsalte** – Line room type of building or building without proper internal arrangement.

**General**- Rectangular shape building with one or two bed rooms, dinning cum sitting area, verandah, kitchen and a detached toilet ect.

**Semi-modern**- House with open verandah/porch two to three bed room, sitting area, dinning area, pantry cum kitchen, attached bathroom, detached toilet ect.

**Modern** – residence with good architectural design tow to tree bed rooms master bed room attached bath room ,detach toilet, living area , dinning room pantry, kitchen, servant room, store room, indoor gardens, balcony ect

**Ultra- modern** – Residential with modern architectural design comprising two to five bed room, master bed room, attached bath room, detached toilet, TV lounge, study room, living area, dinning room ,pantry, Kitchen , Servant room, servant toilet, store room, indoor garden , swimming pool, and out door garden ect

Following table represent the building classification and building rate (Rs) adopted for the purpose of land acquisition

**Table 2: Building Classification and Building Rates**

|   |           |                     |
|---|-----------|---------------------|
| Tile/RCC Roof two storied residential           | -3,750 /= | to 4,500/= Per Sqft |
| Asbestos /RCC Roof two storied residential      | -3,500 /= | to 4,000/= Per Sqft |
| Calicut tiles roofed single storied residential | 3,250/=   | to 4,000/= Per Sqft |
| Country tiles roofed single storied residential | 2,750/=   | to 3,500/= Per Sqft |
| Asbestos roofed single storied residential      | 2,250/=   | to 3,000/= Per Sqft |
| Corrugated iron sheets roofed residential       | 2,250/=   | to 3,000/= Per Sqft |

|   |         |                     |
|---|---------|---------------------|
| Modern Type & Ultra – Modern type house | 3,500/= | to 4,500/= Per Sqft |
| Semi Modern Type house                  | 2,500/= | to 3,500/= Per Sqft |
| Tenement type house & cottage           | 2,000/= | to 2500/= Per Sqft  |
| Open Veranda                            | 1,500/= | to 1,750/= Per Sqft |

|                         |                  |  |
|-------------------------|------------------|--|
| Residential Obsolete    | 4,000/=          |  |
| Residential Semi modern | 4,250/=          |  |
| Residential Modern      | 4,500/=          |  |
| CFR Commercial Building | 3,500 to 4,250/= |  |

|   |       |           |
|---|-------|-----------|
| Residential Building RCC/ASB/Tilled & CI Roofed - Obsolete      |       |           |
| Residential Building RCC/ASB/Tilled & CI Roofed -Semi modern    |       |           |
| Residential Building RCC/ASB/Tilled & CI Roofed - Modern        |       |           |
| Residential Building RCC/ASB/Tilled & CI Roofed Detached - Fire | 750/= | to 1750/= |
| Temporary structure & shade CI thatched                         |       |           |

Nishantha (2018) classified building and proposed building rates (Rs) as follows

**Table 3: Building Classification and Building Rates**

|                           |                        |
|---------------------------|------------------------|
| Obsolete/Ordinary I       | 2,000.00 <sup>+-</sup> |
| Obsolete/Ordinary II      | 2,500.00               |
| Obsolete/Ordinary III     | 3,000.00               |
| Semi-modern/S-Luxury      | 3,000- 3,600.00        |
| modern/ Luxury            | 3,500- 5,500.00        |
| Ultra-modern/Super-Luxury | 4,500- Above           |

Source: Nishantha, (2018).

The classifications were not unique and it was hard to identify buildings to apply respective rate. The existing classification will direct to wrong valuation as an example Obsolete building can identify in deferent way like functional, physical or an economical obsolete where the classification was not clearly defined the type of the obsolescence hence it may lead for the wrong application of the rate by the valuers. It can be observed that roof is the base to classify the building for the purpose of capital valuation but roof itself not direct the cost of construction of the building.

## International Property Measurements Standards (IPMS)

IPMS mainly classified buildings as industrial, office, residential and retail to introduce building measuring standards. ROYAL INSTITUTE OF CHARTED SURVEYORS members are expected to advise their client or employer on the benefits of using IPMS. However, it is understood that IPMS is not suitable in all circumstances and in these circumstances ROYAL INSTITUTE OF CHARTED SURVEYORS members **must** document the reason for departure this professional statement (PS) takes effect from 1 May 2018.

IPMS 2 – Office

(Formerly GIA) Costing – a method of measurement for a basis of calculating building costs and reinstatement costs.

IPMS 2 – Residential

(Formerly GIA) Costing – a method of measurement for a basis of calculating Building costs and reinstatement costs.

### Methods

#### Theoretical Framework

$$\text{Value of Land and Building} = \text{Value of the site} + \text{Cost of erecting the building}$$

Where **Cost of erecting the building** is usually that of constructing approximately the same accommodation without unnecessary features/ Cost of similar assets offering equivalent utility

#### Conceptual Framework

Building classified based on **cost of construction** as shown in following Building classified table

**Table 4: Proposed Building Classification and Building Rates**

| Building Class |    | Cost of construction<br>Rs. |
|----------------|----|-----------------------------|
| Class          | A1 | > 6500                      |
| Class          | A  | 6500-5500                   |
| Class          | B  | 5500-4500                   |
| Class          | C  | 4500-3500                   |
| Class          | D  | 3500-2500                   |
| Class          | E  | 2500-1500                   |
| Class          | E1 | < 1500                      |

Source: Author, (2020)

The Building cost calculator tested with 21 numbers of sample which are located in the limit of Western province. The sample consists with completed building, incomplete building and building under construction.

## Results and Discussion

**Objective 1.** To identify the area that has to improve the consistency of valuation

Literature review that deferent types of building classifications were used for the capital valuation where unique classification were not practiced among the profession and this became a barrier for the consistency of the valuations. A similar building classified in deferent way and then adopted deferent cost rate to derive cost of construction, in addition the building classification was not clearly defined, where thesis factors were raised consistency issues. As in the fact, **Table 04: proposed Building classification and Building rates** are introduced for the practice of the profession base on **cost of construction** of the buildings.

The each building classes can be descriptively defined as per the construction of the building where Class A defined as bellow and refer annexure 01. For the further detail of other building classes.

**Table 6: Building classification for class A**

| Class A              |  |   |           |
|----------------------|--|---|-----------|
| Roof                 | Roofing Materials  | Color -con tile,calicat tile,reinforce cement,Fiber/Galss sheet | Class A   |
|                      | Roof frame   | Sawn timber Class 1, Detail timber frame                        |           |
|                      | Roof Finishers   | Valance Bord-Wooden class 1, Down pipe,Gutters                  |           |
|                      | Ceiling  | Timber class1 Ceiling   |           |
| Structure            | Foundation   | Rcc,Pile,Minipile,Randoum rubble with Rcc column                | Class A   |
|                      | Wall   | 9" Brick, RCC Beams   |           |
|                      | Floor  | RCC,Concrete  |           |
| Fixture and Fittings | Doors  | Timber Class 1 panel with timber, Iron Roller shutter           | 5500-6500 |
|                      | Window   | Timber Class 1 panel with timber                                |           |
|                      | Window protection  | Stainless Steel   |           |
|                      | Bathroom & Toilets-fitting   | A gade Tile   |           |

**Objective 2.** To improve the consistency of capital valuation when using the cost based method of valuation

Building Cost Calculator (BCC) can be used as guide line to identify building class and rebuilding cost of similar building where the BCC can apply even for finished building, incomplete building and even building under construction. The BCC will help to improve the consistency of cost base valuation. Standard deviation of BCC is 2.7% of the cost of construction as per the tested samples. The following table compares the actual cost with cost derived though the Building calculator. Three samples of building classifications were not matched with the actual and the cost deference of this were felled between 6% to 13% of the construction cost where all the others were similar in building class and cost of construction were almost similar of the actual cost of the construction.

**Table 07: Sample Data Analysis**

| Sample ID    | Actual Data |                   |                  |                | Building cost calculator |                |                | Actual vs BCC  |             |
|--------------|-------------|-------------------|------------------|----------------|--------------------------|----------------|----------------|----------------|-------------|
|              | Floor area  | Construction cost | Actual Cost Sqft | Building Class | Cost Derived from BCC    | BCC -Cost Sqft | Building class | Cost Deference | Deference % |

Source: Analysis Data, (2020).

The following chart represents the relationship of actual cost and cost derived from building cost calculator (proposed tool)

**Figure 02: Actual Building Rates Vs BCC Calculated Building Rates**

Source: Author, (2020).

## Conclusion

Building classification table can be used for the classification of buildings in capital valuation. The table will maintain the unique classification of the building among the profession and its will lead the consistency of valuation. Building rate can be adjusted in terms of time and location if necessary.

The **Building Cost Calculator** can be used as a guide line to derived reinstatement/rebuilding cost of similar building where it can be used in capital valuation in cost approached methods.

### Limitation

01. The BCC tested in only Western province
02. Tested building cost range was Rs. 0 to 6,500
03. Standard deviation of the BCC tool is 2.7% as per the sample
04. The Building cost calculator can be applied building that have less than five story
